A highly skilled development executive, Heath has been delivering high-quality software for more than 20 years, all while demonstrating his innovative thought leadership and experience with multiple technology stacks. His deep understanding of product management allows him to build a strong bridge between business and technical teams.

For the past four years, Heath has served as the Senior Director, Software Engineering for Mueller Water Products, actively leading software development, architecture, DevOps, and production operations for a large-scale cloud-based application hosting 1M+ endpoints. Under his leadership, his team successfully built and deployed the world's first integrated IoT water intelligence platform within an agile development culture. As a key member of the executive team, he provided strategic technology direction, while leading five teams, planning budgets, establishing software development processes, and infusing team morale. His contributions in leadership and development now power some of the largest connected energy and utility networks in the world. Previously, Heath held various positions leading software, hardware, and SaaS developments in the energy and connected home industries.

Heath holds a Bachelor of Science in Computer Information Systems from Troy University, where he was awarded the Chancellor's Scholarship.

The proud parents of three, Heath and his wife, Leslie, recently celebrated their 25th wedding anniversary. In his spare time, Heath enjoys mountain biking, golf, and fishing on Lake Lanier.
